Azure-App-And-Container-Services-2

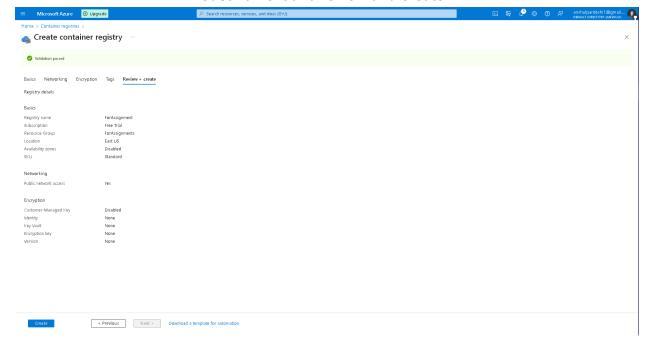

Do the following:

- 1. CREATE AZURE CONTAINER REGISTRY AND CONNECT IT TO DOCKER RUNNING IN VM.
- 2. UPLOAD THE IMAGE YOU CREATED IN THIS AZURE TO CONTAINER REGISTRY.
- 3. CREATE AN APP SERVICE TO THE DEPLOY THE SAME IMAGE.

Let us create a container registry first.m Go to search bar search container registry and click on + icon to create.

Just name it and review and create.

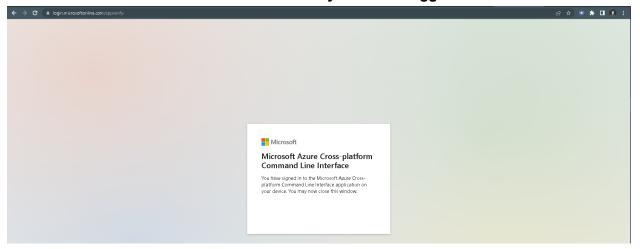

Deployment is complete. Go to resource.

We need to authenticate to container registry. For this: First use command: sudo az login Then copy the link and paste it in browser.

Provide credentials and you will be logged in.

Now use command: az acr login --name <registry-name>

You can see the repo in the registry is empty right now. Let us push image in it.

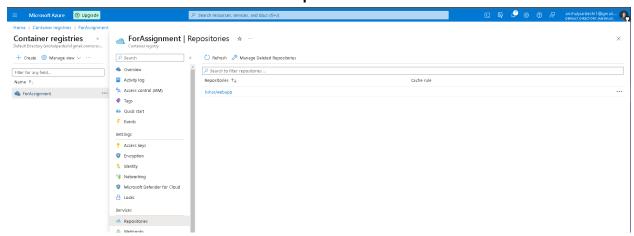

First tag the image using:

docker tag <image-name> <registry-name>.azurecr.io/<image-name> Then push it using:

docker push <registry-name>.azurecr.io/<image-name>

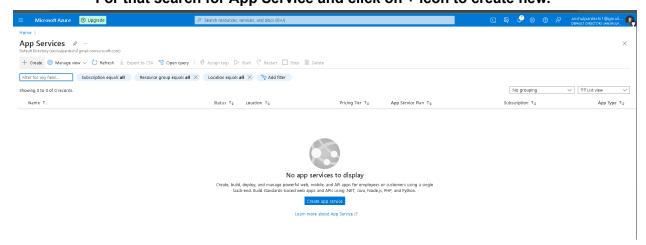

Now, can check repo in container registry for pushed image. It is present!

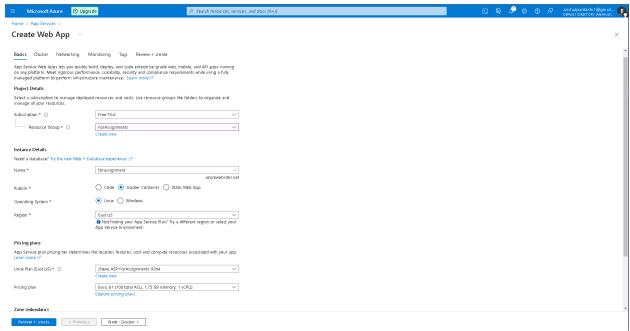

Let us deploy a app service now.

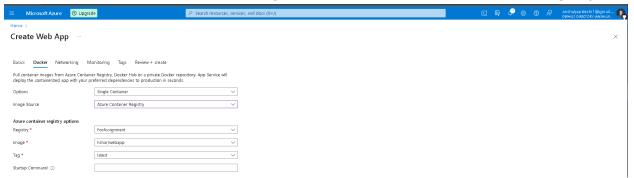

For that search for App Service and click on + icon to create new.

Fill in the basic details. In publish section choose Docker Container.

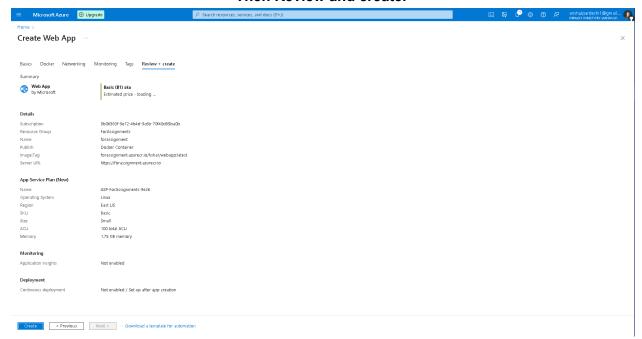

Click on next to Docker. Select Image source as Azure Container Service Registry.

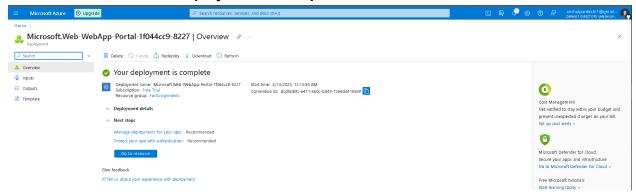

Note: Make sure Admin User is enabled in Container registry in Access keys.

Then Review and create.

Deployment is complete. Go to resource.

Copy the default domain and paste it in browser.

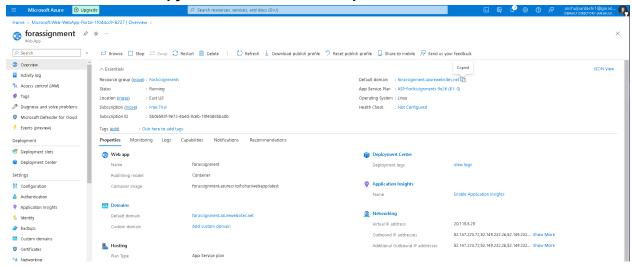

Image has been deployed
